

CaratSpace

Operations Manual

How to run the Éclat Diamonds business on CaratSpace — screen by screen, in the order you will meet them. Every instruction here was checked against the running application.

Prepared for	Éclat Diamonds & Company
Covers	All 57 screens, both WhatsApp numbers
Dashboard	<code>ec1at-diamonds-pi.vercel.app</code>
Issued	5 October 2026

NO PASSWORDS IN THIS DOCUMENT

It names who holds which account, never the password. A manual gets forwarded; a password should not.

How to use this manual

Parts One to Three follow the working day of a salesperson and a store manager, in order. Parts Four to Seven cover each department's own screens. Part Eight lists every screen in the system.

PART ONE — Getting an account, and getting in

The sign-in screen · Login IDs · How an account is created · Who sees what

PART TWO — Starting the day

The attendance screen · What it asks away from the branch · HRMS

PART THREE — Customers and enquiries

Where leads arrive from · Conversations · Follow-ups · A customer's record

PART FOUR — Quoting and selling

Quotations · Discounts and approvals · Payments · Returns · Loyalty

PART FIVE — Stock

Inventory · Transfers · Dead stock

PART SIX — Reporting

The daily report over WhatsApp · Dashboards · Scheduled reports

PART SEVEN — Administration

Branches · Configuration · Adverts · Integrations · Audit

PART EIGHT — Every screen

All 57 screens, grouped as the menu groups them

The addresses you will need

Dashboard	https://eclat-diamonds-pi.vercel.app
Customer WhatsApp number	+91 72080 17690 · wa.me/917208017690
Staff reporting number	+91 72089 12616 · wa.me/917208912616
Live adverts	fb.me/2mtHMsKeUcTN8Ih (Bandra) · fb.me/2jDp44BRWvLmQ4m (Surat)

PART ONE

Getting an account, and getting in

There is exactly one way to sign in, and three ways an account comes to exist. Most questions in the first month are about this one page.

The sign-in screen

Opening the dashboard goes straight to sign-in. Two fields, and nothing else.

Field	What goes in it
Login ID	Generated when the account is created and shown to whoever created it. It looks like an email address but is not one — the Team screen labels it <i>“a sign-in identifier, not an inbox”</i> , so nothing is ever sent to it.
Password	At least 8 characters, set with the account and shared privately. Staff can change it later in their own Settings.

NOTHING IS SENT TO A NEW MEMBER OF STAFF

The Login ID is not an address that can receive anything, so no invitation goes out. Whoever creates the account has to pass on the password — and the Login ID too, unless they are going to sign in with their number. Until that happens the person cannot get in, however many times they try.

IF SIGN-IN IS REFUSED

The message does not say whether it was the ID or the password that was wrong, deliberately. Read the exact Login ID off **Settings** → **Team** before resetting anything: most of the time somebody is guessing at their ID, not their password.

Repeated wrong attempts lock that ID for a few minutes. Waiting is the only fix — a reset does not clear it.

There is no “forgot password” link. A password is reset by somebody with access to Team or Stores, or changed by the person themselves once they are in.

How an account is created

Settings → Team → Add staff

This is the only way. Head office or a store manager creates the account, the Login ID and the password; there is no self-service sign-up and nothing for staff to fill in themselves.

- 1 Enter **Name**, **Phone** (10 digits) and **Personal email**. All three are required, and so is a **Store**.
- 2 **Role** starts at *Salesperson*. Leave it — the dialog notes you can promote them later.
- 3 Set a **Password** of at least 8 characters, or leave it blank and set one afterwards with **Reset password**. An account with no password cannot be signed into yet.
- 4 **Add staff**. A **Login ID** is generated in your organisation's own format and **shown to you once**, there and then.

WRITE THE LOGIN ID DOWN AS IT APPEARS

It is shown once, when the person is added. Nothing is emailed to them. If it is missed, the ID can still be read off the person's row on Team — but the password cannot, and would have to be reset.

Resetting a password

There is a **Reset password** action in two places and either will do: on **Settings** → **Team** against the person, and on **Settings** → **Stores** against their branch. Use whichever screen you are already on.

Staff can also change their own without an admin: their own **Settings** has a **Security** card taking *Current password*, *New password* and *Confirm new password*, and a **Contact details** card for their mobile number and personal email.

Who sees what

Four roles are in use. The role sets the default; head office can then narrow or widen any individual.

Role	Scope	Lands on
Head office	Every branch, every screen, all reporting. The only role that can approve managers, and the only one that sees <i>kaccha</i> estimates on quotations.	Dashboards

Everyone except head office lands on the attendance screen, which passes them through to their own home page once the day is started.

Who may change other people's access

Screen	Who can open it
Settings → Team	Head office and store managers, <i>within your scope</i> . A store manager sees and adds only their own branch's staff; head office sees everyone in the organisation.
Settings → People & Access	Head office only. Nobody else can grant or withdraw an individual screen, and nobody else can change another person's access at all.

On **People & Access**, search by name or store and grant or withdraw individual screens. Left alone, each role keeps its standard set, which suits most people.

There is also one setting for staff who should only ever clock in and out, described on the screen as **“Only Check in / Check out, leave and regularisation”**. Use it for cleaning, security or workshop staff who belong on the register but have no reason to see customers. The attendance screen becomes their home and they stay on it.

ONE WITHDRAWAL THAT QUIETLY BREAKS LEAD ROUTING

A store manager who cannot open **Conversations** is skipped when the system looks for an owner for a new lead. The lead reaches the branch and then sits unowned, with nobody notified. If leads stop being assigned, check this before anything else.

Finding your way around

The furniture is the same on every screen. Five minutes here saves a new starter a fortnight of asking.

Down the left — the menu

Screens are grouped, and the groups collapse. **Collapse all** at the top folds everything away; a group reopens with a click. A number beside a group is how many things in it want attention. The product name and version sit at the very bottom — worth quoting if you ever report a problem.

Faster than hunting: the **search box** at the top of the menu finds a screen by name. Press **/** from anywhere to jump into it, type a few letters, and press **Enter**. **Escape** closes it.

Across the top

What it is	What it does
Branch name	Which branch you are looking at. If you cover more than one, this switches between them, and All Stores shows them together. Everything on the screen follows it — so a figure that looks wrong is often the right figure for a different branch.
Gold rate	Today's rate per gram, the one new quotations price from. If it looks stale, it is — it is set by hand under Settings → Gold Rate.
Bell	Notifications, with a count of the unread. Open one to go straight to what it is about. Mark all read clears the count; Clear read tidies the ones already dealt with.
Your name	Your role is printed beside it — a quick way to answer “why can I not see that screen?”. The menu holds Profile & Settings , Install app , Show welcome tour and Sign out .
Sun / moon	Light or dark. A personal preference, remembered.

START A NEW PERSON ON THE WELCOME TOUR
Your name → **Show welcome tour** walks the screen in place. It can be replayed as often as you like, so it is the right first thing to hand somebody on their first morning — before this manual, not after it.

Put it on the phone

Install app in the same menu adds CaratSpace to the home screen like any other app. Worth doing for anyone who punches attendance, since that happens on a phone at the door rather than at a desk.

IF A SCREEN IS MISSING FROM YOUR MENU
It is not broken. A screen shows only when your role may open it — so a salesperson will not find Team, and only head office finds People & Access. Check the role printed beside your name before reporting it.

PART TWO

Starting the day

Attendance is recorded on its own screen, not by signing in. What that screen does, what it asks when somebody is away from the branch, and how a manager puts a bad day right.

The attendance screen

At `/check-in`. Everyone except head office is taken here on sign-in, and it is the only place a day gets recorded.

What you see

A greeting and today's date, your last shift, and a **Check in for today** button. Once you are in it becomes **Checked out** and then **Done for today**; anybody only passing through gets **Continue to app**. Some branches also ask for an **Attendance photo** with the punch.

What it does about your location

What the phone reports	What happens
Inside the branch fence <i>"Within store range."</i>	Checks in by itself as soon as the location is confirmed. Nothing to type.
Outside the fence	Asks for a Reason , then records the punch and reports it.
A fix too vague to judge <i>"GPS accuracy cannot confirm your location"</i>	Offers the choice in as many words: <i>continue with a reason, or wait for a more accurate GPS reading.</i>
No fix at all <i>"We couldn't read your location"</i>	A reason is required. The punch is saved and marked <i>"Location unavailable — recorded without GPS."</i>
The fence could not be loaded	Also treated as unconfirmed, and asks for a reason.

NOBODY IS EVER LOCKED OUT

A punch is never refused for being in the wrong place. A phone inside a concrete showroom can be wrong by 50–150 m, and refusing the punch does not move the person — it only destroys the record that they came to work. The fence decides whether a punch is *verified*, not whether it is allowed. A reason is still required, because an unexplained punch from outside the branch is indistinguishable from one person punching for another.

"SKIP FOR NOW" EXISTS, AND IT RECORDS NOTHING

The screen has a **Skip for now** button, so somebody who needs the system urgently is not held hostage by a failing GPS. It does **not** mark them present — it only moves them past the screen. Anyone who skips every morning shows as absent all month with no reason recorded. If a month's attendance looks too thin, the register is the first place to look and this is usually why.

Who is told

Every punch the fence could not confirm notifies the branch manager **and** head office, carrying the distance, the branch's allowed radius and the reason typed. Head office is reached whichever branch it was, because the notification goes to everyone ranked at or above store manager. The person who punched is not notified — they know where they were.

HRMS & Attendance

The manager's side of the same data, in eight tabs.

Tab	What it is for
Today	Who is in and who is not, as it stands now.
Employees	The people on this branch's roster.
Register	The month's attendance day by day — the record an audit asks for.
Shifts & Schedule	Who works when: the store default shift and any batch.
Reports	Attendance summaries, exportable.
Leave	Requests and balances. A request raised here lands in Approvals.
Fix attendance	Missed and wrong punches, including the off-site ones flagged for review.
Late flags	Arrivals after the shift start.

Marking somebody present by hand

The **Mark attendance** dialog takes a *Status*, a *Check-in time* and a *Shift / batch*, defaulting to the store default shift. Use it for a phone that died, not as routine: every change is written to the audit log with your name on it.

Putting a flagged punch right

- 1 Open **Fix attendance**. Flagged punches are listed with the distance and the reason the person typed.
- 2 Accept it as it stands, or correct the record.
- 3 Corrections needing a higher sign-off go to **Approvals** → **Attendance fixes**, described there as *missed / wrong-punch corrections awaiting your decision*.

Roster and pay

Roster & Pay turns the register into a payroll month. Driven by a *Month* written `2026-09`, it shows *Present*, *Off / holiday*, *Unpaid*, *Overtime* and *Net pay* per employee, with each run tracked through *Drafted*, *Skipped* and *Issued*.

PART THREE

Customers and enquiries

Six doors an enquiry can arrive through, one inbox it lands in, and the record that remembers everything a customer has ever done.

Where leads arrive from

The Leads screen says it plainly: *leads from ads, the website, WhatsApp and the counter all appear here*. Each door is set up once and then runs itself.

Door	How it is set up
A Click-to-WhatsApp advert	The customer taps it and WhatsApp opens. A routing rule sends the lead to the right branch — Part Seven.
Writing to the number	Nothing to set up. Anyone messaging +91 72080 17690 is answered.
A form on your website	Website enquiry forms: name the form, pick the branch, say what it is about, publish it and paste its link into your site. The customer sees a public page, then “Thank you”.
A QR code in the showroom	Lead QR codes: choose the branch, optionally where it will stand (“Front counter”) and what it advertises (“Bridal collection”), and set <i>stop working after</i> a date. The customer scans, sees “Scan to enquire” and “Tell us what you are looking for”, and the lead arrives tagged to that code.
A walk-in at the counter	Customer Check-ins → Log walk-in & visit.
Typed in by hand	Leads & Follow-ups → Add lead.

THE QR CODE IS THE CHEAPEST ONE TO START WITH

It needs no website change and no advertising spend — print it, stand it on the counter, and every scan is a lead attributed to that spot. Give each position its own code and you can see which part of the showroom actually produces enquiries.

Logging a walk-in

The dialog records *Phone*, *Purpose*, an *Item code* (*scan or type the code*), *What happened*, an *Item note* — the example given is “*wanted it in rose gold, size smaller*” — an *Outcome*, the *Customer feedback / remark*, and **Remind me at**, which creates the follow-up so the visit does not quietly go cold.

Conversations

The WhatsApp inbox, and the busiest screen in the system. Pick a thread on the left to read it, judge it and reply.

What happens before you open it

- 1 The customer taps an advert or writes in.
- 2 If they came from an advert, a routing rule stamps the thread with the branch that paid for it.
- 3 The bot asks its four qualifying questions.
- 4 The thread is handed to that branch's store manager, who is notified by name, and is marked as needing a person.

What you can do in a thread

Action	What it is for
Reply	Free text, with emoji, and an attachment button for a catalogue item or a quotation.
Create Deal / Quotation	Turns the conversation into a quote without retyping the customer. Takes a <i>Deal Name</i> and an <i>Estimated Value</i> .
Schedule Follow-up Task	A <i>Task Title</i> , <i>Due Date</i> and <i>Priority</i> — e.g. "WhatsApp follow-up for solitaire certificate".
Add customer note	Context for whoever picks the thread up next.
Star as VIP Lead	Keeps the thread findable in a busy inbox.
Reassign conversation	Branch first, then owner — the list only offers people at that branch. The new owner is notified; you are not.
Close / Reopen	Close when it is finished; reopen if they come back.
Check for new messages	Forces a refresh when you are expecting a reply.

Each message carries its own state — **Queued, Sent, Delivered, Read** — so "they never replied" can be told apart from "it never reached them".

WHY THE MESSAGE BOX SOMETIMES WILL NOT ACCEPT TYPING

WhatsApp allows a free reply only within **24 hours** of the customer's last message. After that the box is disabled and says so, and only an approved template can reach them. This is WhatsApp's rule, not a setting, and the clock restarts every time the customer writes again.

THE BOT GOES QUIET ONCE A PERSON TAKES OVER

After hand-over the thread is marked for a human and the bot stays silent in it. When testing, message from a number that has never written in before, or it will look as though nothing is working.

Leads, follow-ups and reply times

The leads list

Filter by *Source*, outcome, tags and a *From/To* date range, or search by *name*, *ref* or *phone*. When a filter returns nothing the screen says which knob to turn: *adjust the outcome, source, tags, search or date range to see more*.

Add lead captures name, 10-digit mobile, *where did this lead come from*, *what are they asking about*, address, birthday, anniversary and remarks. Birthday and anniversary are not decoration: they drive the occasion prompts that push a lead up the list.

A row is marked priority when there is recent activity, an imminent follow-up, or a nearby occasion — and the screen says which, rather than leaving you to guess why something is near the top. **Open WhatsApp** on a row starts a thread with that person.

Follow-ups

Follow-ups & Reminders is the day's list. Marking one done takes an optional remark — the example is *"Spoke to customer — coming in Saturday to finalise."* A due date can be edited if they asked for later. Two standard follow-ups are tracked per lead, and the screen tells you when **both SOP follow-ups are done**.

Calling splits into **My tasks** and **All tasks**, and can also **Send WhatsApp Follow-up**. The phone icon hands the number to your own device's dialler — the system records that a call happened, it does not place it.

Reply-time promise

Response & SLA is off until you set it. Enter *Reply within (minutes)* and *Tell a manager after (minutes)*, then press **Start measuring**. The table then shows, per conversation, when *they messaged*, how long they *waited*, who *answered*, and whether **a manager was told**. Until then it says *no reply target is set* and measures nothing.

Consent

Messaging consent is recorded per customer and per channel, split into **Marketing** and **Service replies**. Find somebody by name, phone or email and record what they told you; the history shows what happened, on which channel, recorded by whom and when. Campaigns check this for every recipient, so an opt-out is honoured without anybody having to remember it.

Campaigns

To message a customer outside the 24-hour window you need a template Meta has approved. **New campaign** then walks six questions in plain English: *what is this campaign?*, *who should receive it?*, *who this reaches*, *what does it say?*, *when should it go out?* and *check it over*. Audience rules combine as *all of these* or *any of these*. Afterwards each campaign reports its *Delivery* and per-recipient status with a *Why* column when somebody was skipped.

A customer's record

Nine tabs — and the reason the system is worth having: one person's whole history in one place, however they reached you.

Tab	What is on it
Timeline	Everything, newest first — the <i>omnichannel journey and history</i> .
Identity	Who they are and <i>how we reach this customer</i> : numbers, email, consent.
Leads	Every enquiry they have raised.
Visits	<i>When they came in</i> — check-ins logged at the counter.
Products	<i>What they looked at</i> . Record what somebody was shown or tried and it appears here.
Purchases	Quotes, invoices, payments, returns and exchanges.
Conversations	WhatsApp and other channel threads with this customer.
Qualification	The lead score and the signals behind it.
Attribution	<i>How they found us</i> — the advert, form or code that brought them.

PRODUCTS IS THE TAB MOST SHOPS FORGET

Writing down what somebody tried on and did not buy is the cheapest sales intelligence in the building. It is what makes the next call specific — “the rose-gold band you tried, in your size” instead of “any update?”

How a lead is scored

Every conversation is scored out of 100, so a manager can see who is worth calling first.

Signal	Weight	Recognises
Says they want to buy	+30	“want to buy”, “ready to buy”, “yes, call me now”
Mentions a budget	+20	“budget”, “under ₹50k”
Needs it soon	+20	“this week”, “urgent”
Wants to visit	+15	“visit”, “appointment”, “timings”
Asks about a specific item	+10	“do you have”, “in stock”
Comparing with others	+5	“cheaper”, “other shop”
Raising a complaint	-25	“refund”, “broken”
Says they are not interested	-40	“stop messaging”

Only the customer's words are read; the bot's own questions are excluded, or “What is your budget?” would score every thread. Bands run from **Early** at 1, **Interested** at 30, and the top band at 60 — where the system asks for a person. A thread is not scored until it has at least two messages.

All of it is editable under **Settings** → **Business Configuration** → **Lead scoring**. Scores are stored when calculated, so changing the policy does not rewrite old ones — use the refresh arrow on the Intent panel.

PART FOUR

Quoting and selling

Pricing a piece, getting a discount signed off, taking the money, and handling what comes back.

Quotations

Two tabs: **Quotes**, and **Custom Orders & Timeline** for pieces being made. The list shows *Quote #, Customer, Origin store, Status and Total*.

Building one

- 1 **New.** Enter the customer's name and number.
- 2 Choose the item type, and the style number if there is one — the download arrow pulls that design's materials in automatically.
- 3 Fill the materials table: gold, each stone, making.
- 4 + **Add item** for a second piece. Each keeps its own metal, stones, making and discounts.
- 5 **Create quotation.** GST is added and the total shown.

The materials table

Gold, each stone and the making charge are rows in one list, in the same order as the printed sheet. Every row has its own **Dis %**.

Row	Priced as	Example
Gold	weight (g) × rate per gram, less its discount	$4.90 \times 11,000 = 53,900$
Diamond	carats × rate per carat, less its discount	$0.72 \times 20,000$ -5% = 13,680
Colour stone	carats × rate per carat, less its discount	$2.00 \times 30,000$ -5% = 57,000
Making	gold weight × making rate, less its discount	$4.90 \times 1,200$ -16.66% = 4,900

Those four lines total **₹1,29,480** before GST, matching the shop's own sheet exactly.

Quotations — stones, sizes and sending

Finding a stone

Type what you know — `round`, `VVS`, `ruby`, or the code itself. The box searches shape, quality and group, not only the code, and the carats box offers the standard per-stone weights.

Size, remark and metal colour

- **Size** is set once for the piece — ring size 12, bangle 2.6, chain 16 — with cm, inch, or blank for Indian ring sizes.
- **Remark** carries bespoke instructions: engraving, finish, a customer's own stone.
- **Metal colour** is not asked, because the metal code says it: `G14YG` is 14K yellow, `G14WG` white.

IF IT WILL NOT SAVE

The message names the row — “Item 1, stone 2 of 3: ... needs its carats”. An empty row you added and never used is ignored. A row with figures but no stone code must be completed or cleared.

Two things only head office sees

Kaccha estimates — rough quotes marked with `@` — are hidden from everyone else, with a toggle to show them. The rate a quote is priced from comes from **Settings** → **Gold Rate**; a quote freezes the rate it was priced at, and if the stored rate is stale the system asks you to confirm today's before saving.

Discounts, approvals, payments and returns

Discounts

The screen states the rule: *raise a discount on diamond or making; within store-manager caps it auto-approves, higher amounts escalate for approval. Selling, Cost and Margin sit side by side so the cost of the discount is visible as it is asked for, and a Required column names the approval level needed. Caps are listed per role as a Diamond cap, a Making cap and a Quote cap.*

A rejection needs a **Reason for rejection** — “e.g. Margin too thin at this price.” The requester sees it, which is what stops the same request coming straight back unchanged.

Approvals

One queue, four kinds of thing, each labelled on the screen:

- **Discounts** — diamond / making discount requests routed to you for sign-off.
- **Returns** — returns, exchanges and buybacks awaiting approval.
- **Leave** — staff leave requests pending your decision.
- **Attendance fixes** — missed / wrong-punch corrections awaiting your decision.

Empty, it says *nothing is awaiting your approval* — so a blank screen is an answer, not a failure to load.

Branch Requests is the other side of this. Any member of staff can ask their manager, the area office or head office for a decision — a diamond rate, a price override, a transfer — and follow it by *Ref, Status* and who it is *With*.

Sales & Payments

Three tabs. **Sales** records the sale. **Collections** is the ledger of money actually received — **Record payment** takes an amount, a mode and a *Reference (UPI txn id, cheque no.)*, and every row shows who recorded it. **Reconciliation** sets *store reported* against *bank statement* and shows the *Variance*.

ROWS WITH NOBODY AGAINST THEM

Payments brought across from the old system are labelled *imported from the legacy system* — *no Eclat user behind it*. That is expected for historic rows. A *new* payment with nobody against it is not, and is worth asking about.

Returns & Exchange

Returns, exchanges and buybacks, with **Photo intake** so a piece's condition is recorded as it crosses the counter rather than argued about later. Anything above the permitted threshold raises an approval, and a rejection needs a reason — “e.g. Piece condition does not match the intake photos.”

Loyalty

Two tabs: the **Gold savings scheme**, with enrollment, a **maturity calculator** and members listed by *Plan, Installment and Maturity*; and **Earn with Éclat**, the points programme. Members appear *whether they join at the counter or on your website*, and movements can be announced to your own site over an *https* address.

Targets sets a monthly figure per store and tracks *Achieved* against it. **Sales Performance** is the **Leaderboard** and **Incentives & Commission**.

PART FIVE

Stock

What you hold, what it is worth, what is moving between branches, and what has stopped moving altogether.

Inventory & Stock

Four tabs: **Stock**, **Rotation**, **Melting & Scrap** and **Reorder**.

Entering a piece

Stock entry records a name and SKU (e.g. *NK-22K-0142*), metal and purity, karat, and the weights a jewellery business has to keep apart: *Gross*, *Net* and *Pure*, plus *Diamond count*, *Diamond wt (ct)* and *Stone wt (ct)*. Then *Tag price* and *MRP*, and the compliance fields — **HUID (BIS Hallmark Unique ID)**, *Hallmark no.* and *Certificate no.*

FILL IN THE HUID AS THE PIECE ARRIVES

Hallmarking is a legal requirement, and the HUID is the one field nobody can reconstruct later from the piece in their hand. Entering it at intake costs seconds; finding it afterwards means going back to the supplier.

Stock can be brought in in bulk with **Import stock from Excel**, and many pieces changed at once with **Bulk update status**. A status change needs a reason, and the note field shows the kind of thing wanted: *"Reserved for Priya Sharma, or flagged for melting"*.

Reading the stock list

Filter by category, purity, status, age and store. The cards above give **Aging distribution**, **Store-wise stock**, **Auto-reorder alerts** and **Slow-moving stock**. If reorder alerts are blank the screen says *reorder points are not set up yet* rather than implying all is well.

Melting

Nothing appears under **Melting & Scrap** until a piece is sent there, and the screen says exactly how: *adjust a piece's status to "Sent for melting" in the stock ledger and it will appear here*.

Transfers between branches

Stock Transfers lists each movement by *Ref*, *Route*, *Pieces*, *Status* and who requested it, filtered as *Incoming*, *Outgoing* or *In & out*. Many pieces can be moved at once with **Bulk transfer**.

Dead stock

You define what dead means, per category: *Dead after (days)* and *Warn after (days)* — the suggested figure is 180 — then **Save rule**. The list then shows each piece with its *Threshold*, how far it is *Over by*, its *Tag price* and a *Suggested* action. **Scan a piece tag** looks one up from the counter by piece number.

PART SIX

Reporting

The daily sheet filed from a phone, the dashboards built out of it, and the reports that send themselves.

The daily report, over WhatsApp

Filed by messaging +91 72089 12616. No app, no login, no dashboard.

Giving somebody access — Settings → WhatsApp Reporting

- 1 Open the screen. Everyone in your branches is listed with their Access and when they *last used* it.
- 2 Choose **Set up** on their row. A code appears and is copied to your clipboard. It lasts **10 minutes**.
- 3 Read the code to them. They send it from the handset they want to use, to the staff number.
- 4 That handset is now theirs for reporting. **Remove** undoes it.

WHY YOU NEVER TYPE THEIR PHONE NUMBER

The number is learnt from the message carrying the code, so nobody can bind a handset they are not holding. The bot also cannot open a conversation with a number that has never written to it — WhatsApp only allows that with an approved template, and a one-time code is not something Meta approves.

Filing a report

- 1 Message the number and say *hi*.
- 2 Choose **1** — send today's daily report.
- 3 Answer each question. Reply **0** for none, or **skip** where offered.
- 4 Check the summary, then reply **YES** to file, **CANCEL** to discard, or **DATE 20/08** to file it for another day.

What it asks, in the order of the sheet

Section	Questions
Footfall	Walk-ins · serious enquiries · conversions
Table A — counter sale	Sale value, then cash · card · UPI · old gold taken and its value
Table B — customised sale	Booking value, open bookings, bookings closed, amount received, then its own cash · card · UPI · bank transfer · old gold
Remark	Anything worth noting about the day

IT ONLY ASKS WHAT APPLIES

Nothing sold at the counter? Those payment questions are skipped entirely. No old gold? It does not ask what the gold was worth. A quiet day is **nine** questions; a full trading day is **twenty**.

THE TWO PAYMENT BLOCKS ARE KEPT APART

Counter sale and customised sale each have their own cash, card and UPI, because the shop reconciles the two tables separately. A heading above each question says which table you are filling, and each block must add up to its own total or the bot asks again.

Amounts can be typed the way a jeweller says them — 450000 , 4,50,000 , 4.5L , ₹4.5 lakh , 1.2cr — and all mean the same thing.

Reading the numbers

Reporting & DSR

Two tabs — **This view** and **All stores reports**. **Today's DSR** opens the day's sheet, which can be downloaded as the standard DSR in PDF or Excel, or sent to a *Recipient WhatsApp number*. Reports filed by WhatsApp are marked as such, so they can be told apart from those typed on the dashboard.

Dashboards and Business Activity

Dashboards is the morning screen, with a **Tasks** card — **New task** takes a detail, a *Priority* (Low / Normal / High / Urgent), a due date and an assignee. **Business Activity** answers four questions directly: *when it came in, what sold, what has not sold, and every document*. When a window looks empty it offers the likely cause — *try a wider period, this shop's history may be older than the window*.

Management and Store Comparison

Management is the cross-business view: leads by source, by branch and by stage; conversations by channel and *who replied first*; follow-ups and calling; the floor; quotations by state; feedback; and conversion by source, by branch and by owner.

IT REFUSES TO SHOW A HALF-ANSWER

If a figure cannot be worked out, the screen says *nothing is being shown rather than a partial total* and asks for a narrower date range. A blank here means “we will not guess”, not “you sold nothing”.

Store Comparison ranks branches by revenue.

Reports that send themselves

Scheduled Reports: give it a *Name*, *How often*, the *Hour at the branch*, a branch, who to **Send to** (comma-separated addresses) and which *Columns*. You can also download or re-send the last completed period by hand. With none set up it suggests where most shops start: *a month-end lead report is the usual first one*.

Morning Digest tells each person what they owe a customer that day, at an *Hour (0–23)* you choose, using a named template. The **What mine says right now** card previews your own and says *nothing owed today* when there is nothing to send.

Feedback

Two tabs — **All answers** and **Needs a person**. A Google review link can be set so a happy customer is pointed at it automatically.

PART SEVEN

Administration

Branches, what your business calls things, the adverts, and the connections to Meta and your website.

Branches

Settings → Store Setup. Regions first, then branches.

- **Add region** — e.g. *West India*, code *WEST*. A branch can sit without one, listed as *no region yet*.
- **Add store** — name (*Surat — Main*), city, code (*SRT-01*), region and phone.
- **Edit store & geofence** — *Latitude, Longitude* and **Geofence Radius (metres)**. The suggested value is **150**.
- **Add store manager** — name, Login ID, mobile, and a password of at least 8 characters.
- **Reset password**, and **Close store** when a branch stops trading.

SETTING THE GEOFENCE RADIUS

Too tight and staff standing at their own counter are asked to explain themselves every morning: a phone indoors is routinely 50–150 m out, and the stored coordinate is usually a street centroid rather than the door. Too wide and it stops meaning anything. Start at the suggested 150 m, then widen a branch if its staff are being flagged while genuinely at work — the flagged punches on **Fix attendance** carry the distances that tell you by how much.

Branches arriving from a connected system land in an **Import holding area** as **Branches to review**, rather than going live unseen.

Opening a new showroom

New-Store Setup runs a launch as a project: a **five-department launch checklist**, milestones (*e.g. T-30, Stock & dry-run complete*) and **Vendor assignments** with amounts and due dates. Each project has a launch date and a project lead.

What your business calls things

Settings → Business Configuration. Six tabs, and the first changes wording across the whole system.

Tab	What it controls
Vocabulary	Your industry's terms. Choose an industry for a starting set, then edit.
Custom fields	Extra fields on your records — <i>applies to</i> picks the record, then name the field (e.g. <i>Warranty period</i>).
Sales stages	The stages a lead moves through.
Lead scoring	The phrases, weights and bands from Part Three.
Ad routing	Which branch an advert's leads go to.
Customer identity	How two records are judged to be the same person, with a possible duplicates list.

Advert routing

Match on	Use when
Ad-set name contains	The one to prefer. One rule per showroom, matching a word your marketing team already puts in the ad-set name — "Bandra", "Udaipur". Every future advert in that ad set routes with no further work.
Exact ad ID	Pinning one advert somewhere different, or a campaign whose ad-set name carries no location.

Where two rules match, the more specific wins — "Bandra Broadway" beats "Bandra", with no manual ordering.

NAME MATCHING NEEDS THE META ADS CONNECTION

A Click-to-WhatsApp tap reports the advert's ID and nothing else. Turning that into an ad-set name needs **Meta Ads** connected with a token that can read adverts. Without it, only exact-ad-ID rules can match.

A BRANCH WITH NO MANAGER NOTIFIES NOBODY

A rule can send leads to a showroom that has no active store manager. The lead arrives correctly and then sits, because there is nobody to tell. Before adding a rule for a branch, make sure it has an active manager who can open Conversations.

If a lead arrives unrouted: open the thread, read the advert card, add a rule for that advert or its ad set, then **Reassign** the lead that already arrived. Existing threads are never re-routed automatically, by design.

Sharing a live advert

Each advert has three addresses. The posts are the advert as published; the preview link shows it with the WhatsApp button attached, which is usually what you want when demonstrating it.

Advert	Where	Address
Bandra	Facebook post	facebook.com/1281780938358230/posts/1293013417234982
	Instagram post	instagram.com/p/DdwKr6isgc0/
	Advert preview	fb.me/2mtHMsKeUcTN8Ih
Surat	Facebook post	facebook.com/1281780938358230/posts/1293013430568314
	Instagram post	instagram.com/p/DdwKr8wM4h5/
	Advert preview	fb.me/2jDp44BRWvLmQ4m

MOST OF THE TRAFFIC IS INSTAGRAM, NOT FACEBOOK

Placements are left to Meta to choose, and it has settled on Instagram: over the week before this manual was issued, Instagram carried **96%** of the Bandra advert's views and **82%** of Surat's, Reels largest of all. Worth knowing before judging an advert by how it looks in a Facebook feed.

Where advert money went

Ad performance puts *Spend*, *Clicks*, *Revenue* and *Return* side by side per campaign, with a *Mapping* column showing whether that campaign is tied to a branch. **Lead capture failures** lists enquiries Meta sent that could not be taken in, with why and how many attempts were made — so a broken connection shows up as a number rather than as silence.

Connections, messaging and records

Integrations

Grouped as **Your connections**, **Available to connect** and **Not available yet**, so it is clear what is on, what could be, and what is not offered at all. A connection needing work outside CaratSpace says **Platform setup required** rather than failing quietly.

For WhatsApp you add a **phone number ID** from Meta and the **WhatsApp Business Account ID** from WhatsApp Manager, and each number records *who writes to it*. Meta assets can be registered by *Type* and *Meta id* with a label — *what your team calls it* — and **Connection health** re-checks each against Meta and shows when it was last confirmed.

Messaging Routes

Maps each branch to the number it answers on, and shows which number *sends from* where. With nothing connected it says *no WhatsApp number is connected* and points at Integrations first.

Message Templates

Each template with its language, what the *provider says* about it, and whether it **can be sent**. That last column is the one to read: Meta's approval decides it, not anything in CaratSpace.

When a message does not go out

Outbound messages shows everything composed and its state. **Waiting for a person** is the one to watch, and it is written to reassure when empty: *every outbound message is either delivered or already attached to a delivery job that will run on its own. Nothing is stuck* means exactly that.

Channels

One table: each **Channel**, what it can do **right now**, **why** if it cannot, and when it was last **confirmed with provider**. The quickest answer to "can we message customers today?".

Records, imports and the audit trail

Data & Imports

Tabs for **Sources**, **Import a file**, **History**, **AI knowledge** and **Where data came from**. Every import is listed *with exactly what it did*. Map a file's columns once and save the mapping — *next month it is one click*. **Product Images** matches a folder of photographs to products by reading the filename, with the prefix and suffix to ignore set by you.

Catalogue

Search by *style no*, *SKU* or *name*. **Catalogue integration** connects your website and the Gati connector, explains **what each number counts**, and maintains the **visual search index** behind image search.

Audit Log

Every sensitive action with *When*, *Actor*, *Action*, a summary and the branch, filterable by action, store and date. This is where a hand-marked attendance, a role change or a discount approval is answered for.

Ticketing

For when something in the shop is broken rather than something a customer wants: *raise an internal ticket for an operational issue; it auto-routes to a resolver team by category*. The example sets the tone — *"POS terminal freezes during billing"* — and the description asks for *what happened, since when, and what you already tried*.

Getting Started

Settings → **Getting Started** lists what is set up and what is still outstanding. Worth revisiting a month in, when the gaps are the things nobody got round to.

PART EIGHT

Every screen

All 57 screens, grouped as the menu groups them. This list is generated from the application itself, so it cannot fall out of step with what you see.

The complete screen reference

A screen appears in your menu only if your industry package includes it and your role may open it — so not every person sees every row below.

Today 4 screens

What needs attention this morning.

Screen	What it is for
Dashboards /dashboards	Your store's key numbers and shared team tasks.
Business Activity /activity	When it sold, what sold, and what is still sitting.
Approvals /approvals	Discount, return and leave requests awaiting your approval.
Branch Requests /requests	Ask your manager, area office or head office for a decision — diamond rates, price overrides, transfers and more.

People 9 screens

Every customer conversation, lead and follow-up.

Screen	What it is for
Conversations /conversations	Every customer message, on every channel, in one place.
CRM & Leads /crm	Leads and follow-ups for every customer enquiry.
Calling /calling	Every follow-up owed to a customer, oldest first, with the history on one screen before you dial.
Reminders /reminders	Today's and overdue lead follow-ups.
Customers /customers	Your store's customer directory — contacts, purchase history and key dates.
Feedback /feedback	Ask a customer how it went; an unhappy answer reaches a person, not a public review page.
Response SLA /conversations/sla	The promise to answer within five minutes, measured — who is late, and who was told.
Archived Contacts /customers/archived	People taken out of the working lists. Their consent history is kept, which is what stops them being messaged again.
Tasks /tasks	Everything owed to a customer or a colleague, in one list.

Showroom 3 screens

The shop floor — walk-ins, the counter, the catalogue.

Screen	What it is for
In-Store App /instore	Find a walk-in, see what they came for, and record the visit from a phone.
Check-ins & Footfall /checkins	Log walk-ins and assign each customer to a sales rep.
Catalogue /catalogue	Browse products across stores; search by photo.

Selling 4 screens

Quoting, discounting and what happens after a sale is agreed.

Screen	What it is for
Quotation & Orders /quotation	Build quotes and custom orders; custom orders route to production.
Orders in Production /timelines	Every order being made, booked here or imported from the factory, and its stage.
Discounts /discounts	Request and approve discounts with live margin checks.
Returns & Exchange /returns	Returns, exchanges, buyback, repairs and old-gold trade-ins.

After the sale 5 screens

Collections, loyalty, performance and targets.

Screen	What it is for
Sales & Payments /payments	Record sales with advance and balance, and track collections and bank reconciliation.
Loyalty & Referral /loyalty	Gold-savings schemes and the customer referral wallet.
Sales Performance /sales-performance	Sales leaderboard, commission and incentives.
Targets /settings/targets	Set monthly sales targets per store and track achievement.
Points Programme /loyalty/programme	What a purchase earns, what a point is worth, and the key your own website signs in with.

Stock 3 screens

What you hold, what moves and what will not.

Screen	What it is for
Inventory & Stock /inventory	Stock levels, aging lines and scrap recovery.
Stock Transfers /stock-transfers	Move stock between branches — request, Head-Office approval, dispatch and receipt.
Dead Stock /inventory/dead-stock	Pieces that have not moved, against thresholds you set per category rather than one number for everything.

Reports 5 screens

The numbers, for a branch and across the business.

Screen	What it is for
Reporting & DSR /reporting	Automated daily sales reports and store analytics.
Store Comparison /store-comparison	Revenue, orders and staff across all stores, side by side.
Finance & Fund Planning /finance	Ledgers, budgets, cash flow and expansion costs.
Management View /management	Leads, conversations, follow-ups, the floor, quotes and feedback across every branch, over a period you choose.
Scheduled Reports /reporting/scheduled	Reports that send themselves at month-end, and what happened to the last one.

Team 3 screens

Who works here, their attendance and their pay.

Screen	What it is for
Team /settings/team	Add staff, assign roles and stores within your scope.
HRMS & Attendance /hrms	Geo-attendance, rosters, leave and regularization.
Roster & Pay /hrms/payroll	Each person's own weekly off, and a payslip counted from the attendance register.

Setup 20 screens

Configuration, integrations and administration.

Screen	What it is for
Campaigns /campaigns	Send one approved message to a group of customers, with consent checked per person.
Enquiry Forms /lead-forms	Publish a form for your own website that files enquiries straight into a branch.
Marketing /marketing	Plan campaigns and track agency deliverables.
Ticketing /ticketing	Raise and track operational issues with the back office.
Getting Started /settings/onboarding	What is set up and what is left — industry, locations, team, data and channels.
People & Access /settings/access	Choose, person by person, which screens they can open and how far.
Store Setup /settings/stores	Add branches, review the ones a connected system has sent through, and assign logins.
New-Store Setup /new-store	Tasks and timelines for opening new stores.
Business Configuration /settings/configuration	Your industry, what your business calls things, and which fields your team fills in.
Gold Rate /settings/rates	The live gold rate every new quote is priced from — auto-updates from the market; override it here if needed.
Integrations /settings/integrations	Connect the systems and channels your business already uses.
WhatsApp Reporting /settings/dsr-access	Who can file a daily report over WhatsApp, and who still needs setting up.
Message Templates /settings/integrations/templates	Write a WhatsApp message and put it to Meta for approval. Approved ones are what campaigns send.
Data & Imports /data	Import your existing records and check what each connected system has delivered.
Audit Log /settings/audit	A record of approvals, role changes and other sensitive actions.
Morning Digest /settings/staff-digest	The message that tells somebody what they owe a customer today, and exactly what it would say.
Lead Tags /settings/lead-tags	Your own labels for a lead, and what they mean.
Product Images /data/images	Match a folder of photographs to the products you already have, and reuse the column mapping you worked out last month.
Messaging Routes /settings/messaging-routes	Which of your numbers each branch answers on, so a customer is replied to by the shop they wrote to.
Channels /settings/channels	What can actually reach a customer today, and what is missing where it cannot.

Outside the menu 1 screen

Screens the application opens for you rather than listing in the menu.

Screen	What it is for
Attendance /check-in	Check in and check out. <i>Reached automatically after signing in, not from the menu.</i>
