

One platform that turns customer activity into organised work.

A plain-language guide for someone seeing CaratOS for the first time. CaratOS is a multi-company CRM and operations platform; Eclat is its jewellery implementation, not the whole product.

The essential rule: a customer and a lead are not the same. Importing a customer does not create a fake opportunity. A lead appears only when a real enquiry or sales opportunity occurs.

The entire system as a work tree

Start at the top and read downward. Each branch is a group of capabilities.

Industry packs: the same platform changes its visible modules and language per client. A clinic sees patients/services; manufacturing sees accounts/items/plants; Eclat keeps its jewellery workflows.

UML-style component map

This shows which technical layer owns each responsibility.

Provider webhooks never choose their own tenant. CaratOS resolves the tenant from a registered Page, form, phone-number or connection asset.

How a customer becomes a lead

Source	Customer profile	Lead creation
Meta Lead Ad	Match/create using form phone or email	Automatic when a safe location is known
Click-to-WhatsApp ad	Match/create using WhatsApp identity	Create/reuse open lead for that customer and location
Ordinary WhatsApp	Match known customer; may remain anonymous	Not automatic

Location QR	Match/create using submitted phone	Automatic for the QR's signed location
Staff entry	Match/create after lead capture	Immediate, with staff-selected source/location
Excel/ERP customer import	Create/update customer master	No lead until a real opportunity occurs

Customer-to-lead flow

CaratOS

Three important operating flows

Messaging and AI

Inbound message

Store conversation

STOP/complaint/legal screening

Retrieve tenant knowledge

AI creates draft

Human approves

Consent + 24-hour/template checks

Outbox → provider → receipt

ERP and file sync

Tally / BUSY / Gati / Excel

Read-only connector or upload

Discover columns

Map to neutral fields

Preview errors/conflicts

Tenant-scoped idempotent import

Reconcile and report

AI catalogue

Upload product image/data

Validate file and tenant

AI suggests metadata

Human reviews facts

Approve product

Create versioned embedding

Visual search and feedback

Attendance/check-in flow

Employee action

Server time + location evidence

Shift/geofence rules

Attendance record

Manager correction with audit

Attendance is rules-based and auditable; it does not need an AI model for the MVP.

Where it runs and what is live

✓ Built and locally tested

🔧 Staging ready

🔧 Needs provider/client setup

🚫 Production unchanged

Area	Present state	What remains
Core multi-tenant platform	✓ Built, tested and pushed in PR #3	Approve merge after staging acceptance
CRM + Meta/WhatsApp code	✓ Built; fixtures and database tests pass	Real signed Meta traffic and credentials
Staging	🔧 Separate Railway backend/database and Vercel preview	Unlock preview, enter test credentials and allowlist testers
Production	🚫 Still on the older main commit	Backup, merge, migrations, deploy and smoke test
Tally/BUSY/custom ERP	✓ Connector/import framework	Client database mapping and onsite acceptance
AI catalogue/attendance	✓ Existing product foundations	Industry/client-specific acceptance and provider setup

Current truth: most product code exists. The remaining work is predominantly access, credentials, real-provider testing, client-specific mapping, PR approval and controlled production rollout.

Glossary

Webhook

A provider calling CaratOS when something happens.

Adapter

A translator between

Idempotent

Repeating the same event does not create duplicates.

CaratOS and another system.

Attribution

Evidence of which campaign produced an opportunity/result.

Tenant

One client organisation and its isolated data.

Outbox

The durable queue of messages waiting for delivery.

Deployment and status

CaratOS
